Respected Sir,

I really appreciate your stance of defining a broadband speed. It was really important for India that we get our fair share of broadband and not be duped by service providers for calling 64kbps a broadband network.

When we look at other developed countries and the way they have defined the broadband network, it doesn't make any sense that we Indians are still stuck at 64kbps. Technically also it makes no sense. When you get to use the whole gamut of spectrum that is all other countries have and when the technology to provide better and faster service is becoming increasingly cheaper day by day, why are we stuck with such a stupid definition of broadband?

One of the reasons could be that service providers want to earn money by providing top-up plans, which no one will buy when you define broadband at a certain speed. They will be forced to become better. They will be forced to improve faster. They will be forced to compete better. And it is the need of time.

We should move ahead at a faster rate if we truly want to be a power in the world. We have all the right ingredients and you own the rights for the correct recipe.

Please make sure you take the correct decision. Request you to define broadband speeds with a minimum of 2Mbps. We can't be left behind in this race to the top.

Thank you for reading.

Best regards,
Sushant Kadam
